

## Wrapping up our last topic: You and your (DNA) parasites

Events like these, happening over and over again, have led to...

Edward Marcotte/Univ. of Texas/BCH391U/Spring 2015

## Wrapping up our last topic: You and your (DNA) parasites

Classes of interspersed repeat in the human genome

			Length	Copy number	Fraction of genome
LINES	Autonomous	ORF1 ORF2 (pol) AAA	6–8 kb	850,000	21%
SINEs	Non-autonomous	AB AAA	100–300 bp	1,500,000	13%
Retrovirus-like elements	Autonomous	gag pol (env)	6–11 kb	450,000	8%
	Non-autonomous	(gag)	1.5–3 kb		
DNA transposon fossils	Autonomous	transposase	2–3 kb	300,000	3%
	Non-autonomous	[ ]	80–3,000 bp		

~45%

**Bottom line: Roughly half of your (and my) genome is the fossil wreckage of genomic parasites.**

**We know this (in part) from sequence alignments.**

Edward Marcotte/Univ. of Texas/BCH391U/Spring 2015

(apologies—missing the citation, now lost)

So far, we've talked about

- DNA, RNA and protein sequences
- How to compare sequences to decide if they are related
- Having databases full of sequences and comparing them rapidly (BLAST)

In fact, many such databases exist, so today we'll start with a brief tour of some of the biological data on the web.

Edward Marcotte/Univ. of Texas/BCH391L/Spring 2015

Just some of  
the resources  
available for  
bioinformatics

Think of these  
as the raw  
data for new  
discoveries

Database	Records	Address
dbEST	74,186,692 public entries	<a href="http://www.ncbi.nlm.nih.gov/dbEST/">http://www.ncbi.nlm.nih.gov/dbEST/</a>
DIP	75,019 protein interactions	<a href="http://dip.doe-mbi.ucla.edu/">http://dip.doe-mbi.ucla.edu/</a>
EcoCyc/MetaCyc	>1,900 pathways	<a href="http://www.ecocyc.org">http://www.ecocyc.org</a> , <a href="http://www.metacyc.org">http://www.metacyc.org</a>
Entrez Genome	1000's of genomes (including ~4,500 viruses)	<a href="http://www.ncbi.nlm.nih.gov/genome?db=genome">http://www.ncbi.nlm.nih.gov/genome?db=genome</a>
Genbank	135,440,924 sequence records spanning 126 billion bases in traditional Genbank (as of 2013); 191 billion bases in WGS division	<a href="http://www.ncbi.nlm.nih.gov/Genbank/GenbankOverview.html">http://www.ncbi.nlm.nih.gov/Genbank/GenbankOverview.html</a>
Gene Expression Omnibus (GEO)	877,498 mRNA or protein expression data sets	<a href="http://www.ncbi.nlm.nih.gov/geo/">http://www.ncbi.nlm.nih.gov/geo/</a>
Genomes Online Database (GOLD)	20,581 genome sequences (many in progress)	<a href="http://www.genomesonline.org/cgi-bin/GOLD/index.cgi">http://www.genomesonline.org/cgi-bin/GOLD/index.cgi</a>
Human Protein Atlas	millions of images of ~14K human proteins' expression in 46 tissues, 20 cancers, 47 cell lines	<a href="http://www.proteinatlas.org/">http://www.proteinatlas.org/</a>
KEGG	Most known pathways, in 435 graphical diagrams and 2,455 organisms (via homology)	<a href="http://www.genome.ad.jp/kegg/">http://www.genome.ad.jp/kegg/</a>
Medline	>22 million references	<a href="http://www.ncbi.nlm.nih.gov/PubMed/">http://www.ncbi.nlm.nih.gov/PubMed/</a>
Mouse Genome Informatics	~20,000 mouse genes, diverse associated data & annotations	<a href="http://www.informatics.jax.org/">http://www.informatics.jax.org/</a>
Online Mendelian Inheritance in Man (OMIM)	Compendium of human genes and genetic phenotypes, data for >12,000 genes	<a href="http://www.ncbi.nlm.nih.gov/omim/">http://www.ncbi.nlm.nih.gov/omim/</a>
Pride	> 342 million peptide mass spectra from 27K experiments	<a href="http://www.ebi.ac.uk/pride/">http://www.ebi.ac.uk/pride/</a>
Reactome	1,371 pathways involving 6,571 proteins, for human, similar for extra organisms	<a href="http://www.reactome.org/">http://www.reactome.org/</a>
SGD	~6,000 yeast genes, diverse associated data & annotations	<a href="http://www.yeastgenome.org/">http://www.yeastgenome.org/</a>
Yeast GFP database	protein subcellular localization for ~4,500 yeast proteins	<a href="http://yeastgfp.yeastgenome.org/">http://yeastgfp.yeastgenome.org/</a>
Yeast regulatory network	~11,000 transcription factor/downstream gene pairs	<a href="http://web.wi.mit.edu/young/regulatory_code/">http://web.wi.mit.edu/young/regulatory_code/</a>

Edward Marcotte/Univ. of Texas/BCH391L/Spring 2015

**Just some of the resources available for bioinformatics**

**Think of these as the raw data for new discoveries**

Database	Records	
dbEST	74,186,692 public entries	>75K protein-protein interactions
DIP	75,019 protein interactions	
EcoCyc/MetaCyc	>1,900 pathways	<a href="http://www.ecocyc.org">http://www.ecocyc.org</a> , <a href="http://www.metacyc.org">http://www.metacyc.org</a>
Entrez Genome	1000's of genomes (including ~4,500 viruses)	
Genbank	135,440,924 sequence records spanning 126 billion bases in traditional Genbank (as of 2013); 191 billion bases in WGS division	
Gene Expression Omnibus (GEO)	877,498 mRNA or protein expression data sets	GEO has ~900K experiments, each measuring 1000's of mRNA or protein abundances
Genomes Online Database (GOLD)	20,581 genome sequences (many in progress)	
Human Protein Atlas	milli expr	<a href="http://www.proteinatlas.org/">http://www.proteinatlas.org/</a>
KEGG	Meta	
Medline	>22	Medline has >22 million research articles, many with complete text online
Mouse Genome Informatics	~20,000 mouse genes, diverse associated data & annotations	
Online Mendelian Inheritance in Man (OMIM)	Compendium of human genes and genetic phenotypes, data for >12,000 genes	OMIM = the most important resource for human genetic disease
Pride	> 342 million peptide mass spectra from 27K experiments	>1,300 biochemical processes and reactions, described in detail
Reactome	1,371 pathways involving 6,571 proteins, for human, similar for extra organisms	
SGD	~6,000 yeast genes, diverse associated data & annotations	
Yeast GFP database	protein subcellular localization for ~4,500 yeast proteins	<a href="http://yeastgfp.yeastgenome.org/">http://yeastgfp.yeastgenome.org/</a>
Yeast regulatory network	~11,000 transcription factor/downstream gene pairs	<a href="http://web.wi.mit.edu/young/regulatory_code/">http://web.wi.mit.edu/young/regulatory_code/</a>

Edward Marcotte/Univ. of Texas/BCH391L/Spring 2015

Live demo OMIM,  
Reactome,  
Human Protein Atlas

**It's nice to know that all of this exists, but ideally, you'd like to be able to do something constructive with the data.**

**That means getting the data inside your own programs.**

**All of these databases let you download data in big batches, but this isn't always the case, so....**

We saw one way to do this in AppSoma. Here's another.

Edward Marcotte/Univ. of Texas/BCH391L/Spring 2015

**Let's empower your Python scripts to grab data from the web.**

We'll use Python library/module = an optional, specialized set of Python methods

This particular Python module is called ***urllib2***.

urllib2 is:

- A collection of programs/tools to let you to surf the web from inside your programs.
- Much more powerful than the simple tasks we'll do with it.
- More details: <http://docs.python.org/2/library/urllib2.html>

Edward Marcotte/Univ. of Texas/BCH391L/Spring 2015

**The basic idea:**

We first set up a “request” by opening a connection to the URL.

We then save the response in a variable and print it.

If it can’t connect to the site, it’ll print out a helpful error message instead of the page.

You can more or less use the commands in a cookbook fashion....

Edward Marcotte/Univ. of Texas/BCH391L/Spring 2015
**For example:**

```
import urllib2                                # include the urllib2 module

url = "http://www.utexas.edu/"

try:                                           # this 'try' statement tells Python that we might expect an error.
    request = urllib2.urlopen(url)            # setup a request
    page = request.read()                     # save the response
    print page                                # show the result to the user

except urllib2.HTTPError:                     # handle a page not found error
    print "Could not find page."
```

→ Run this...

Edward Marcotte/Univ. of Texas/BCH391L/Spring 2015

→ We just captured the UT web page and printed it out (minus the images)...

```
>>>
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Strict//EN"
"http://www.w3.org/TR/xhtml1/DTD/xhtml1-strict.dtd">
<html xmlns="http://www.w3.org/1999/xhtml" xml:lang="en" lang="en" dir="ltr">

<head>
<meta http-equiv="Content-Type" content="text/html; charset=utf-8" />

```

...and so on...

Edward Marcotte/Univ. of Texas/BCH391L/Spring 2015

**That was a static web page.**

**Let's try one that requires some sort of action,  
for example by entering a document id or an id code for a  
sequence.**

**Many web pages pass this information along in the web URL  
itself...**

Edward Marcotte/Univ. of Texas/BCH391L/Spring 2015

## Here's a complete Python program to retrieve a single entry from Medline:

```
import urllib2
pmid = 11237011

# Insert the pmid where the {} are in the following URL:
url = "http://www.ncbi.nlm.nih.gov/pubmed/{0}?report=medline&format=text".format(pmid)

try:
    request = urllib2.urlopen(url)
    page = request.read()
    print page
except urllib2.HTTPError:
    # handle page not found error
    print "Could not connect to Medline!"
```

Edward Marcotte/Univ. of Texas/BCH391L/Spring 2015

## If you run that program, you should get back...

```
>>>
<?xml version="1.0" encoding="utf-8"?>
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN" "http://www.w3.org/TR/xhtml1/DTD/xhtml1-
transitional.dtd">

```

**We just printed it. We could have  
saved it or extracted data from it.  
For example...**

[and so on]

Edward Marcotte/Univ. of Texas/BCH391L/Spring 2015

**Here's our Python program again to retrieve a single entry from  
Medline. How would we modify this to count the authors?**

```
import urllib2
pmid = 11237011

# Insert the pmid where the {} are in the following URL:
url = "http://www.ncbi.nlm.nih.gov/pubmed/{0}?report=medline&format=text".format(pmid)

try:
    request = urllib2.urlopen(url)
    page = request.read()
    print page
    # there might be an error!

except urllib2.HTTPError:
    # handle page not found error
    print "Could not connect to Medline!"
```

Edward Marcotte/Univ. of Texas/BCH391L/Spring 2015

Here's our Python program again to retrieve a single entry from Medline. How would we modify this to count the authors?

```
import urllib2
pmid = 11237011

# Insert the pmid where the {} are in the following URL:
url = "http://www.ncbi.nlm.nih.gov/pubmed/{0}?report=medline&format=text".format(pmid)

try:
    request = urllib2.urlopen(url)
    page = request.read()
    print page.count("AU - ")
except urllib2.HTTPError:
    print "Could not connect to Medline!"
```

# there might be an error!

Medline begins author lines with "AU - ", so...

# handle page not found error

→ Run this, & get ... >>> 255

So, there were 255 authors on one (of the two) human genome papers

Edward Marcotte/Univ. of Texas/BCH391L/Spring 2015

- Queries to Medline or any other NCBI database, including GenBank, are described at:  
<http://www.ncbi.nlm.nih.gov/books/NBK3862/>
- You can often figure out the form of the URL just by looking something up in a database, then noting the address of the web page with the data.
- This very simple approach could easily be the basis for:
  - a home-made web browser
  - a program to consult biological databases in real time
  - a program to map the internet, etc.
- Of course, with this kind of power available to you, the imagination reels...

Edward Marcotte/Univ. of Texas/BCH391L/Spring 2015
