

**BCH394P/BCH364C Systems Biology & Bioinformatics** (course # 55680/55580)  
**Spring 2021**      **Tues/Thurs**      **11 – 12:30 PM**      **Web-based**

Instructor: Prof. Edward Marcotte      marcotte@utexas.edu  
Office hours: Fri 11 AM – 12 noon      On the class Zoom channel

TA: Vy Dang      vyqtdang@utexas.edu  
Office hours: Mon 3-4/Wed 1-2      On the class Zoom channel      Slack: bch394pbch364c2021.slack.com  
Course web page:      [http://marcottelab.org/index.php/BCH394P\\_BCH364C\\_2021](http://marcottelab.org/index.php/BCH394P_BCH364C_2021)

Open to graduate students and upper division undergrads (with permission) in natural sciences and engineering.  
Prerequisites: Basic familiarity with molecular biology, statistics & computing, but realistically, it is expected that students will have extremely varied backgrounds. UGs have additional prerequisites, as listed in the catalog.

**An introduction to systems biology and bioinformatics**, emphasizing quantitative analysis of high-throughput biological data, and covering typical data, data analysis, and computer algorithms. Topics will include introductory probability and statistics, basics of Python programming, protein and nucleic acid sequence analysis, genome sequencing and assembly, proteomics, synthetic biology, analysis of large-scale gene expression data, data clustering, biological pattern recognition, and gene and protein networks.

\*\* Note that this is not a course on practical sequence analysis or using web-based tools (although we'll use those too), but rather on algorithms, exploratory data analyses and their applications in high-throughput biology. \*\*

Most of the lectures will be from research articles and slides. For sequence analysis, there will be an **Optional text:** *Biological sequence analysis*, Durbin, Eddy, Krogh, Mitchison, Cambridge Univ. Press (ebook available from Amazon, ~\$13 to 32.00)

For biologists rusty on their stats, *The Cartoon Guide to Statistics* (Gonick/Smith) is very good (really!).

We will also be learning some Python programming. The following is highly recommended:

Python programming for beginners: <https://pythonforbiologists.com/introduction/>

Online homework will be assigned and evaluated using the free bioinformatics web resource Rosalind (<http://rosalind.info/faq/>). **Enroll here:** <http://rosalind.info/classes/enroll/8e60607640/>

**No exams will be given. Grades will be based on online homework** (counting 30% of the grade), **3 problem sets** (given every 2-3 weeks and counting 15% each towards the final grade) **and a course project** (25% of final grade), which can be collaborative (1-3 students/project). The course project will consist of a research project on a bioinformatics topic chosen by the student (with approval by the instructor) containing an element of independent computational biology research (e.g. calculation, programming, database analysis, etc.). This will be turned in as a link to a web page. **The final project is due by midnight, April 26, 2021. The last 3 classes will be spent presenting your projects to each other. (Presentations count for 5/25 points of the project grade.)**

All projects and homework will be turned in electronically and time-stamped. No makeup work will be given. Instead, all students have 5 days of free "late time" (for the entire semester, NOT per project, and counting weekends/holidays). For projects turned in late, days will be deducted from the 5 day total (or what remains of it) by the number of days late (in 1 day increments, rounding up, e.g. 10 minutes late = 1 day deducted). Once the full 5 days have been used up, assignments will be penalized 10 percent per day late (rounding up), e.g., a 50 point assignment turned in 1.5 days late would be penalized 20%, or 10 points.

Homework, problem sets, and the project total to a possible 100 points. There will be no curving of grades, nor will grades be rounded up. We'll use the plus/minus grading system: A= 92 and above, A-=90 to 91.99, etc. Here are the grade cutoffs:  $92\% \leq A$ ,  $90\% \leq A- < 92\%$ ,  $88\% \leq B+ < 90\%$ ,  $82\% \leq B < 88\%$ ,  $80\% \leq B- < 82\%$ ,  $78\% \leq C+ < 80\%$ ,  $72\% \leq C < 78\%$ ,  $70\% \leq C- < 72\%$ ,  $68\% \leq D+ < 70\%$ ,  $62\% \leq D < 68\%$ ,  $60\% \leq D- < 62\%$ ,  $F < 60\%$ .

Since we will be in coronavirus lockdown this semester, the entire class will be web-based. We will hold lectures by Zoom during the normally scheduled class time. Log in to the UT Canvas class page for the link, or, if you are auditing, email the TA and we will send the link by return email. Slides will be posted before class so you can follow along with the material. We'll record the lectures & post the recordings afterward on Canvas so any of you who might be in other timezones or otherwise be unable to make class will have the opportunity to watch them. Note that the recordings will only be available on Canvas and are reserved only for students in this class for educational purposes and are protected under FERPA. The recordings should not be shared outside the class in any form. Violation of this restriction by a student could lead to Student Misconduct proceedings.

Students are welcome to discuss ideas and problems with each other, but **all programs, Rosalind homework, problem sets, and written solutions should be performed independently** (except the final collaborative project). Students are expected to follow the UT honor code. **Cheating, plagiarism, copying, & reuse of prior homework, projects, or programs from CourseHero, Github, or any other sources are all strictly forbidden and constitute breaches of academic integrity and cause for dismissal with a failing grade, possibly expulsion (<https://deanofstudents.utexas.edu/conduct/academicintegrity.php>)**. In particular, any materials found online (e.g. in CourseHero) that are associated with you, or any suspected unauthorized sharing of materials, will be reported to Student Conduct and Academic Integrity in the Office of the Dean of Students. These reports can result in sanctions, including failure in the course.

We'll cover the following topics, approximately in this order:

### **BASICS OF PROGRAMMING**

Introduction to Rosalind  
A Python programming primer for non-programmers  
Rosalind help & programming Q/A

### **BIOLOGICAL SEQUENCE ANALYSIS**

Substitution matrices (BLOSSUM, PAM) & sequence alignment  
Protein and nucleic acid sequence alignments, dynamic programming  
Sequence profiles  
BLAST! (the algorithm)  
Biological databases  
Markov processes and Hidden Markov Models

### **GENOMES, PROTEOMES, & "BIG BIOLOGY"**

Gene finding algorithms  
Genome assembly & how the human genome was sequenced  
We'll (probably) attempt a live, in-class (on zoom) demo of nanopore DNA sequencing!  
An introduction to large gene expression data sets  
Promoter and motif finding, Gibbs sampling  
Clustering algorithms, hierarchical, k-means, self-organizing maps, force-directed maps  
Classifiers, k-nearest neighbors, Mahalanobis distance  
Principal component analysis and data transformations

## **NETWORK & SYNTHETIC BIOLOGY**

Biological networks: metabolic, signaling, graphs, regulatory

Deep homology and the evolution of traits

Designing, simulating, and building gene circuits

Genome design and synthesis

Also, we'll have several guest lectures sprinkled throughout the semester on:

**NGS best practices; Mass spectrometry shotgun proteomics; and Protein 3D modeling**

**\*\*\* THE FINAL COURSE PROJECT IS DUE by midnight, April 26, 2021 \*\*\***

The last 3 class days will be devoted to presenting your projects to the rest of the class.

**Note that there is NO CLASS over spring break (March 16 & March 18) or on May 6.**
