World's largest genome belongs to slow-growing mountain flower

An unremarkable and slow-growing plant has stunned scientists after they found it had the world's largest genome – 50 times bigger than that of our own species.

The DNA contained within Paris japonica dwarves all other plant and animal genomes that have been analysed so far Photo: CLIVE NICHOLS

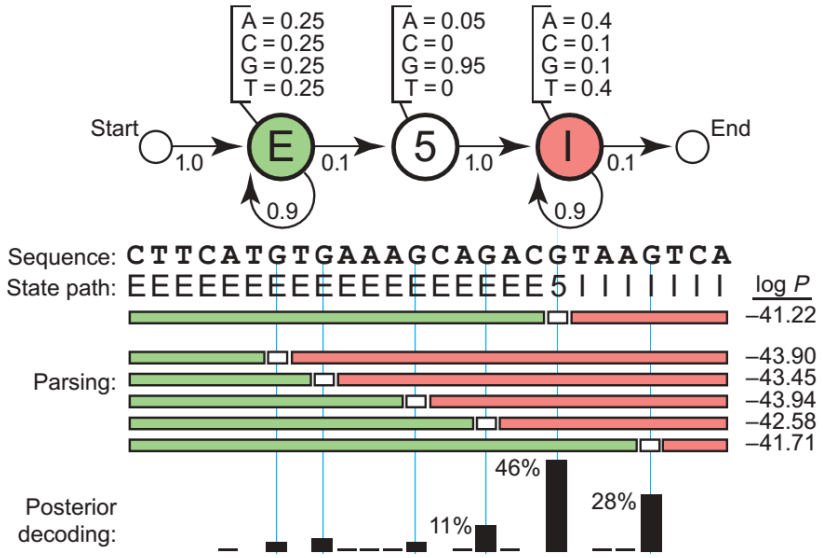
A toy HMM for 5′ splice site recognition (from linked on the course web page)

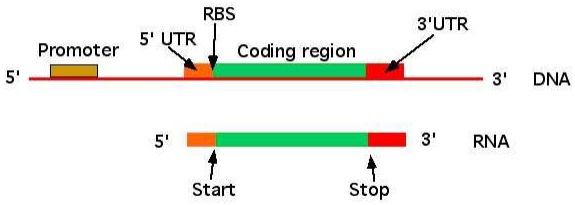
Remember this?



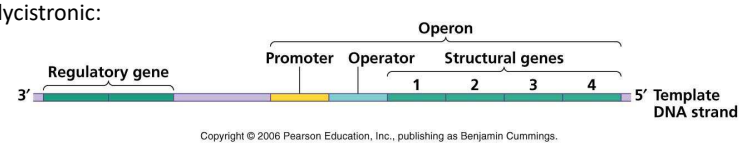
Let's start with prokaryotic genes

What elements should we build into an HMM to find bacterial genes?

Let's start with prokaryotic genes



Can be polycistronic:

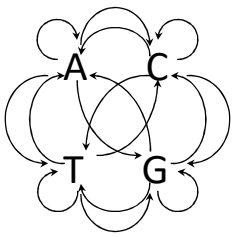


http://nitro.biosci.arizona.edu/courses/EEB600A-2003/lectures/lecture24/lecture24.html

A CpG island model might look like:

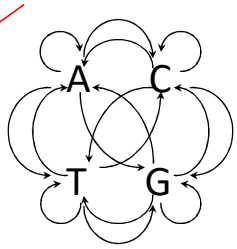
Remember this?

(of course, need the parameters, but maybe these are the most important….)



p(C→G) is higher

CpG island model

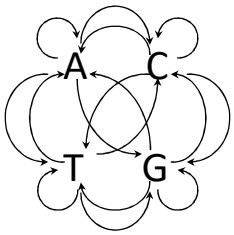


p(C→G) is lower

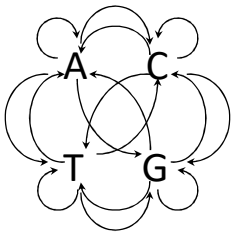
Not CpG island model

Could calculate $\frac{P(X \mid \text{CpG island})}{P(X \mid \text{not CpG island})}$ (or log ratio) along a sliding window, just like the fair/biased coin test

One way to build a minimal gene finding Markov model



Transition probabilities reflect codons



Transition probabilities reflect intergenic DNA

Coding DNA model

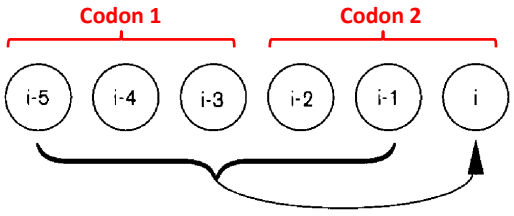
Intergenic DNA model

Could calculate $\frac{P(X \mid \text{coding})}{P(X \mid \text{not coding})}$ (or log ratio) along a sliding window, just like the fair/biased coin test

Really, we'll want to detect codons.
The usual trick is to use a *higher-order Markov process*.

A standard Markov process only considers the current position in calculating transition probabilities.

An *n^{th}-order Markov process* takes into account the past *n* nucleotides, e.g. as for a 5th order:



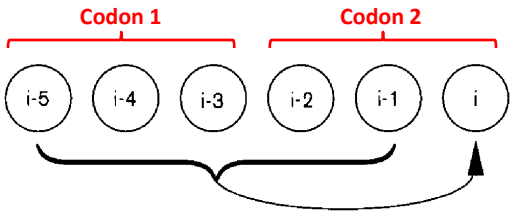
But we need to learn $4^{(n+1)}$ transition probabilities!
That's 4096 entries for a 5th-order model.

Image from *Curr Op Struct Biol* 8:346-354 (1998)

e.g. the 5th-order Markov process transition probability table would be something like this:

Previous nucleotides		Next nucleotide	Frequency
AAAAA	→	A	0.26
AAAAA	→	C	0.24
AAAAA	→	T	0.24
AAAAA	→	G	0.26
AAAAC	→	A	0.25
AAAAC	→	C	0.26
AAAAC	→	T	0.24
AAAAC	→	G	0.25
AAAAT	→	A	0.24
AAAAT	→	C	0.26
AAAAT	→	T	0.25
AAAAT	→	G	0.25
...			

and 4,084 more transition probabilities



But we need to learn $4^{(n+1)}$ transition probabilities!
That's 4096 entries for a 5th-order model.

Image from *Curr Op Struct Biol* 8:346-354 (1998)

5th order Markov chain, using models of coding vs. non-coding using the classic algorithm GenMark

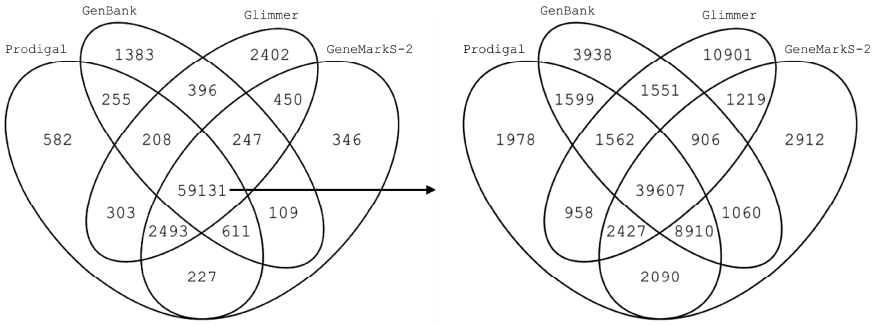
How well does it do on well-characterized genomes?

Genome	Genes annotated	Genes predicted	Exact prediction (%)	Missing genes (%)	Wrong genes (%)
A.fulgidus	2407	2530	73.1	10.8 (2.0)	15.1
B.subtilis	4101	4384	77.5	3.6 (2.8)	9.8
E.coli	4288	4440	75.4	5.0 (2.7)	8.2
H.influenzae	1718	1840	86.7	3.8 (3.2)	10.2
H.pylori	1566	1612	79.7	6.0 (4.4)	8.7
M.genitalium	467	509	78.4	9.9 (1.7)	17.3
M.jannaschii	1680	1841	72.7	4.6 (0.8)	12.9
M.pneumoniae	678	734	70.1	7.8 (4.1)	13.6
M.thermoauthotrophicum	1869	1944	70.9	5.0 (3.5)	8.6
Synechocystis	3169	3360	89.6	4.0 (1.5)	9.4
Averaged	21 943	23 194	78.1	5.4 (2.7)	10.4

But this was a long time ago!

What about the current state of prokaryote gene models?

Here's the overlap in gene predictions from 4 algs on 20 test strains:



Coding regions agree (shared stop)

Starts and stops agree

AssessORF: combining evolutionary conservation and proteomics to assess prokaryotic gene predictions

Deepank R. Korandla [1,2,3], Jacob M. Wozniak[4,5], Anaamika Campeau[4,5], David J. Gonzalez[4,5] and Erik S. Wright [3,*]

Bioinformatics, 36(4), 2020, 1022–1029

What about the current state of prokaryote gene models?

- **"We applied AssessORF to compare gene predictions offered by GenBank, GeneMarkS-2, Glimmer and Prodigal on genomes spanning the prokaryotic tree of life.**
- **Gene predictions were 88–95% in agreement with the available evidence, with Glimmer performing the worst but no clear winner.**
- ***All programs were biased towards selecting start codons that were upstream of the actual start."***

Bioinformatics, 36(4), 2020, 1022–1029

What about the current state of prokaryote gene models?

The title of this paper says it all…

Bioinformatics, 38(5), 2022, 1198–1207
https://doi.org/10.1093/bioinformatics/btab827
Advance Access Publication Date: 7 December 2021
Original Paper

Genome analysis

No one tool to rule them all: prokaryotic gene prediction tool annotations are highly dependent on the organism of study

Nicholas J. Dimonaco [1,*], Wayne Aubrey [2], Kim Kenobi [3], Amanda Clare [2,†] and Christopher J. Creevey [4,†]

[1]Institute of Biological, Environmental and Rural Sciences, Aberystwyth University, Aberystwyth SY23 3PD, UK, [2]Department of Computer Science, Aberystwyth University, Aberystwyth SY23 3DB, UK, [3]Department of Mathematics, Aberystwyth University, Aberystwyth SY23 3BZ, UK and [4]School of Biological Sciences, Queen's University Belfast, Belfast BT7 1NN, UK

If you need to pick just one:

"…overall, we found Prodigal to be one of the most well-rounded tools…"

https://github.com/hyattpd/Prodigal

PRODIGAL = PROkaryotic **DY**namic Programming **G**enefinding **AL**gorithm

- Microbial (bacterial and archaeal) gene finding program developed at Oak Ridge National Laboratory and the University of Tennessee.
- Can analyze an entire microbial genome in 30 seconds or less
- Can run in metagenomic mode and analyze sequences even when the organism is unknown
- Freely available under the General Public License
- Note: it does **NOT** predict RNA genes, viral genes, deal with frameshifts, or genes with introns

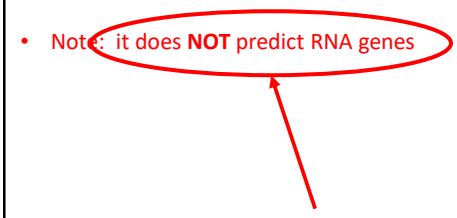
From their web page about the algorithm:

"**Prodigal's algorithm for gene prediction follows the basic principle of KISS (Keep It Simple, Stupid).** Compared to other methods, Prodigal's naive log-likelihood functions seem deceptively simple. Despite its lack of complexity (no Hidden Markov Model, no Interpolated Markov Model, etc.), Prodigal nonetheless achieves good results."

→ log-likelihood hexamer statistics + dynamic programming over the set of all start-stop pairs in the genome

https://github.com/hyattpd/prodigal/wiki/Introduction

- Note: it does **NOT** predict RNA genes

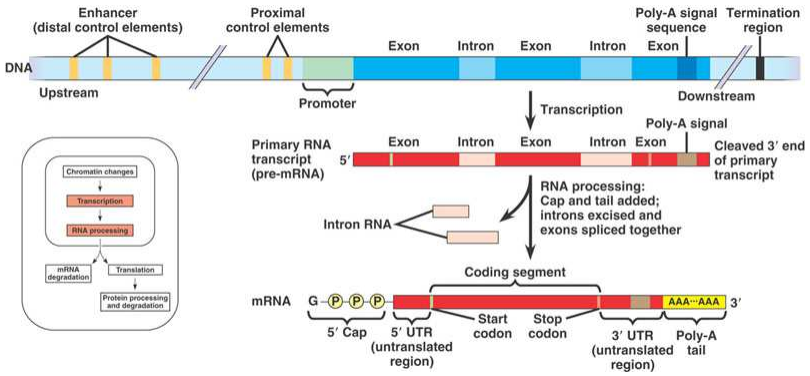


This seems kind of important.
Any suggestions for how to do this?

Eukaryotic genes

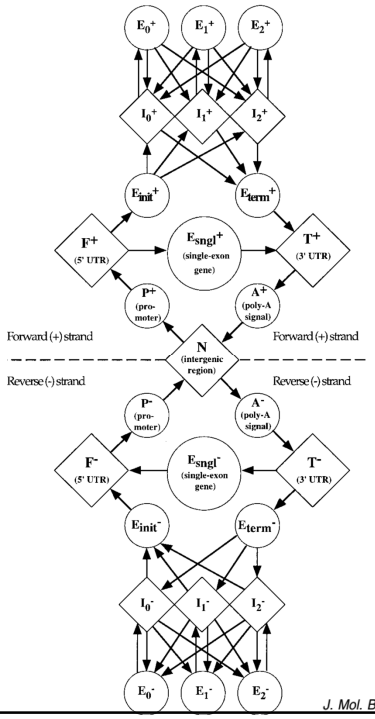
What elements should we build into an HMM to find eukaryotic genes?

Eukaryotic genes



http://greatneck.k12.ny.us/GNPS/SHS/dept/science/krauz/bio_h/Biology_Handouts_Diagrams_Videos.htm

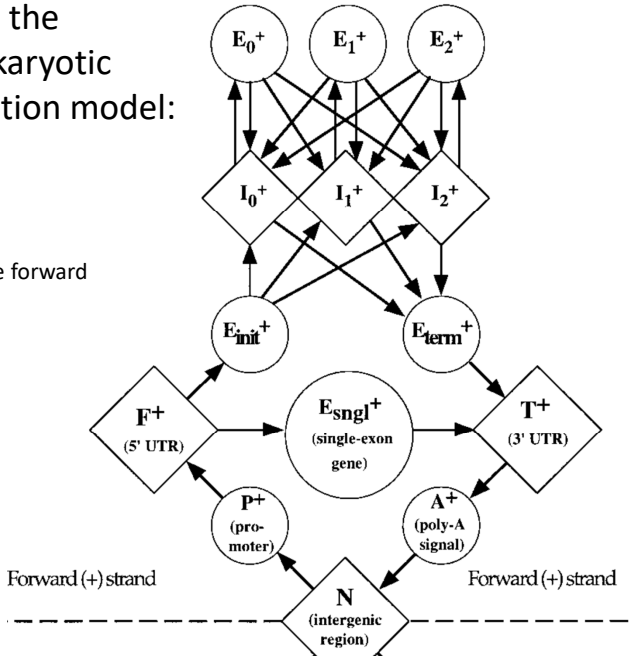
We'll look at the GenScan eukaryotic gene annotation model:



J. Mol. Biol. (1997) **268**, 78–94

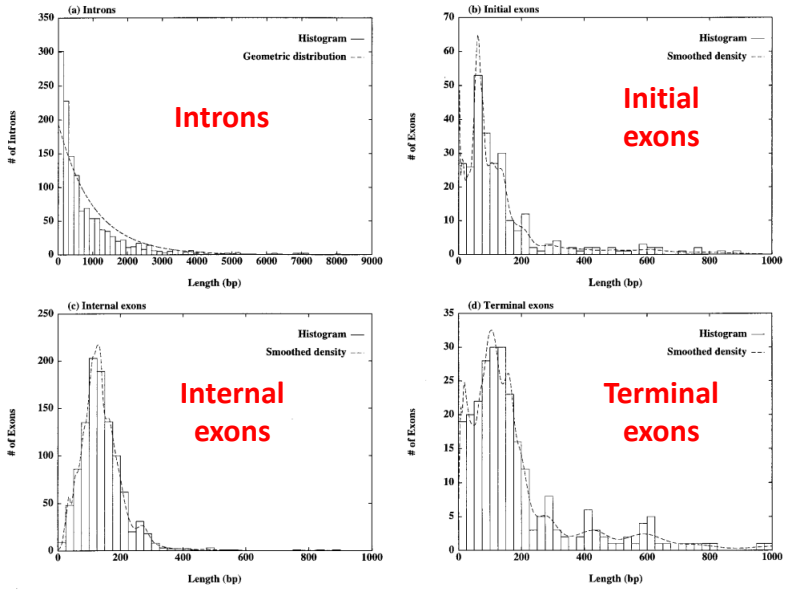
We'll look at the GenScan eukaryotic gene annotation model:

Zoomed in on the forward strand model…



J. Mol. Biol. (1997) **268**, 78–94

Introns and different flavors of exons all have different typical lengths



J. Mol. Biol. (1997) **268**, 78–94

Taking into account donor splice sites

Genome Biology 2006, **7(Suppl 1):**S2

In the year *2006*

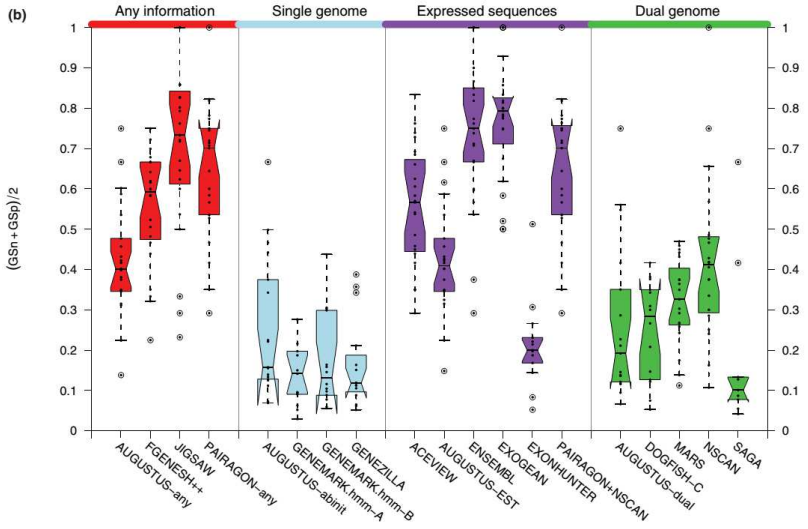
So how did they do?

- "The best methods had <u>at least one gene transcript</u> correctly predicted for close to **70%** of the annotated genes."
- "…<u>taking into account alternative splicing</u>, … only approximately **40%** to **50%** accuracy.
- At the coding <u>nucleotide</u> level, the best programs reached an accuracy of **90%** in both sensitivity and specificity."

Genome Biology 2006, **7(Suppl 1):**S2

At the gene level, most genes have errors

In the year *2006*



Genome Biology 2006, 7(Suppl 1):S2

How well do we know the genes now?

In the year *2019*

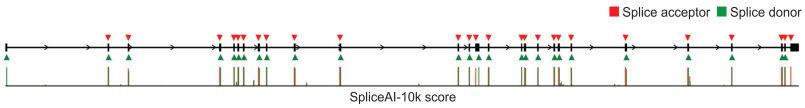
The bottom line:

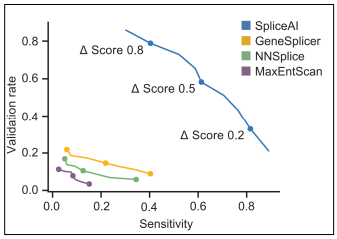
- **Gene prediction and annotation are hard**
- **Annotations for all organisms are still buggy**
- **Few genes are 100% correct; expect multiple errors per gene**
- **"even after 18 years of effort, the precise exon–intron structure of many human protein-coding genes is not settled. The annotation of most other eukaryotes—with the exception of small, intensively studied model organisms like yeast, fruit fly and Arabidopsis—is in worse shape than human annotation."**

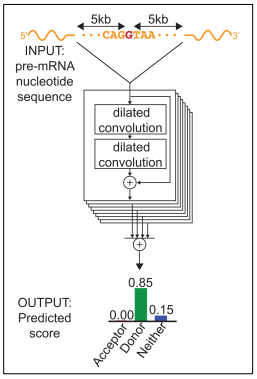
Next-generation genome annotation: we still struggle to get it right
SL Salzberg, *Genome Biology* (20) 92 (2019)

But the algorithms are nonetheless getting better, e.g. new advances (at last!) in predicting splice sites using deep learning

In the year *2019*







Predicting Splicing from Primary Sequence with Deep Learning

Kishore Jaganathan,[1,2] Sofia Kyriazopoulou Panagiotopoulou,[1,2] Jeremy F. McRae,[1,2] Siavash Fazel Darbandi,[2] David Knowles,[3] Yang I. Li,[3] Jack A. In practice, gene finding and genome annotation combines all lines of evidence, e.g. as for the frog genome:

Align frog RNA sequencing data (ESTs and cDNA) & BLAST genes from other animals vs. frog assembly → **Define gene segments**

↓

Integrate *ab initio* gene predictions & BLAST hits using Fgenesh and GenomeScan (= GenScan successor, *Genome Research* 11:803 (2001))

↓

Refine with RNA-seq and H3K4me3 data

↓

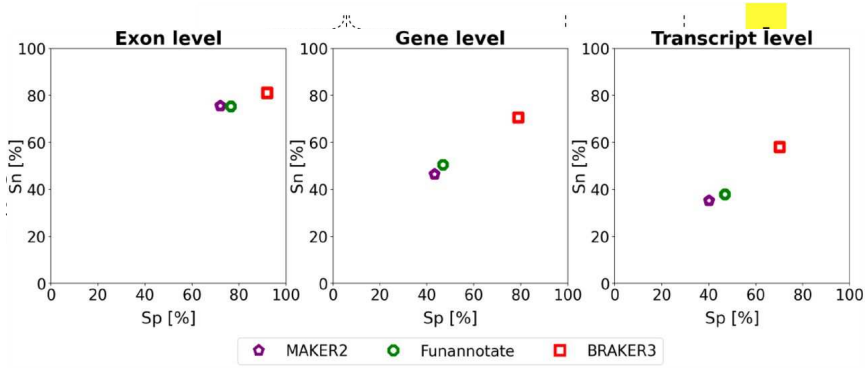
Refine vs final genome assembly

↓

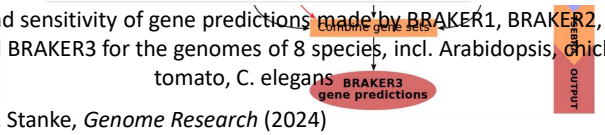
Manually curate 412 gene models
→ Estimate 96% accuracy overall

Session *et al., Nature* 2016
Supplementary Info, pg. 22

If you want to annotate eukaryotic genes yourself with a current state-of-the-art approach, BRAKER3 is a good option that combines evidence from GeneMark, AUGUSTUS (another HMM that incorporates expression evidence)



Average specificity and sensitivity of gene predictions made by BRAKER1, BRAKER2, TSE-BRA, GeneMark-ETP, and BRAKER3 for the genomes of 8 species, incl. Arabidopsis, chicken, fly, tomato, C. elegans



Gabriel, …, Borodovsky, Stanke, *Genome Research* (2024)
